

## Examination of FoxPro Files

I am the Director of IT and Senior Forensic Consultant at In2itive Technologies in Portland, Oregon. In2itive Technologies is a company that specializes in Computer Forensics and Electronic Discovery. I have 7 years experience in the computer forensic field, and have handled numerous cases ranging from simple data recovery to investigations concerning litigation in billion dollar lawsuits, involving both civil and criminal investigations. My training and certifications include the following: EnCase Certified Examiner (EnCE); EnCase Intermediate Analysis and Reporting; EnCase Advanced Analysis and Reporting; AccessData Forensic ToolKit BootCamp; AccessData Forensic ToolKit Windows Forensics; CompTIA A+ Computer Technician (CompTIA A+); Microsoft Certified Systems Engineer (MSCE); Microsoft Certified Systems Administrator (MCSA); and Sun Java Certified Programmer (SJP).

I was asked to evaluate for the presence of and viability of (ability to function as originally written) database program files for FoxPro, based on FoxPro file extensions, that could be recovered from the 120 GB hard drive. FoxPro is the database program that Max Zweizig was programming in while doing work for NorthWest Direct and the 120 GB hard drive was being used by Mr. Zweizig.

Using forensic methods, FoxPro database files were identified by extension on the 120 GB hard drive used by Max Zweizig. The majority of the files may be “recoverable using forensic” methods but all have the potential to jeopardize the integrity of the software product that they are to be used with. Using several examples, I will demonstrate the areas of concern and why a simple restore process will not protect the integrity of the files in all cases.

As background, when a hard drive is formatted, it is prepared for storage of electronic data. Part of the process is creating boundaries for how much data can be stored in one sector. For the NTFS file system, this is normally 4096 bits, or about 1 page of a double spaced document.

As an explanation, the average user, after deleting a file, can recover that file by going to the Recycle Bin and restoring the file. This is possible because the Windows operating system does not actually delete a file until the Empty Recycle Bin option is selected by the user. For clarity purposes, a deleted file for this report is a file that is no longer available to the average user. This could be as a result of emptying the Recycle Bin, using the Shift-Delete process or reformatting the hard drive.

After a hard drive is newly formatted, all the files stored on the hard drive are grouped together. However, as files are added and deleted, open sectors (4096 bytes) of unused hard drive space are created where deleted files had been stored. The operating system will use these “empty” sectors to store new files. On closer inspection at a forensic byte level, it is actually seen that the “empty” sectors are not actually empty but contain the byte level code of the previous file that had been located in that location. This is because when a file is deleted, the file is not erased but rather, the Master File Table in the NTFS file system marks the “deleted” file area as available to be used if space is needed.

As new files are saved to the hard drive, the files are written to the first available open sector and it overwrites the previous data. However, if the new file is larger than the original file that was previously

stored in that area, the NTFS file system will break the file apart and store parts of the file in separate locations. This is file fragmentation and is a normal consequence of hard drive usage.

Exhibit 1 displays the identified FoxPro files that are “recoverable using forensic” means. The columns of particular interest are the Extents column and the Overwritten column. The Extents column denotes how fragmented the file is known to be. The Overwritten column denotes the current known status of the file during the recovery process.

For explanation purposes, I will be using the data from Exhibit 1 Line 347 to allow evaluation of the viability of the recovered files.

The file *daily.SCT*, on Line 347 was found during the recovery process. Looking at the Extents column on Line 347, it is seen that there are 3 extents. In essence, this denotes that the forensic recovery process determined that the file *daily.SCT* has been stored on three sectors of the hard drive. For an allocated file, this is not a problem as the Master File Table in the NTFS file system keeps track of where each fragment is stored. However, during the recovery process, it could only be determined that the file was located in three different sectors on the hard drive.

At this point, the forensic recovery process must make an assumption that does not always bear out. This assumption is that because this is a recovery of deleted files, ***the next available “empty” sector*** is part of the deleted file. This is not always a valid assumption. If an additional file is deleted, any sectors assigned to the second deleted files may become ***the next available “empty” sector***.

On Line 347, this is exactly what has happened. In Exhibit 2, the code that is assumed to be part of the recovered file *daily.SCT* is displayed as a computer program would see it, one contiguous section of code. To enhance readability, text format is displayed instead of the hexadecimal values (Exhibit 4) used to store data on the hard drive. Even a quick perusal of Exhibit 2 allows the casual viewer to see that there are distinct differences of style throughout the file.

Exhibit 3 is broken into the 3 “extents” that are indicated in the Extents column. As such, each section of Exhibit 3 denotes the 4096 bytes that is present in the three different sectors that were used to “recover” *daily.SCT*. Exhibit 3 Lines 1 through 30 is the first sector, Extent 1. Exhibit 3 Lines 32 through 76 is the second recovered sector, Extent 2. Exhibit 3 Lines 78 through 130 is the third recovered sector, Extent 3. It should be readily apparent that the ***“next empty sector”*** assumption does not hold true in all instances.

In Exhibit 1, the Overwritten column identifies files as Overwritten as signified by the Yes in the Overwritten column. This is a result of the forensic recovery process identifying that the first sector belonging to the “recovered” file has subsequently been allocated to a different file. In this instance, the initial sector for the file *daily.SCT* from Line 347 can be traced back to another file that was on the hard drive, namely, *“DISCOVER\_042903\_DEA01.XLS”*.

As seen with the above example of a single file, the “forensic” recovery of a deleted file can be, and should be suspect, as to its recoverability and viability. Out of the files that are “recoverable using

forensic” means, Overwritten files are identified by the recovery system as being unreliable due to the first sector in each of the Overwritten files as being identified as containing data from a different file. Exhibit 2 and Exhibit 3 show that the Overwritten designation raises the question of viability for every file identified as Overwritten.

Extrapolating the process to the all “forensically recoverable” files raises further issues regarding the viability of forensically recovered files. Even if a file is not identified as Overwritten, the Overwritten designation is only applicable if the forensic recovery process is able to identify that the first sector of a file has been re-assigned to another file.

As such, the “*next empty space*” assumption used to “forensically” recover a file raises the question of viability for every file. Even if the Overwritten designation is not assigned to a “forensically recoverable” file, the file may not contain the actual data that was originally in the file before being deleted.

In conclusion, the main purpose of forensically recovering deleted files is to show that the files were present on the hard drive and to forensically investigate details concerning those files to develop realistic scenarios as to events surrounding those files. The accurate recovery of every file using a forensic recovery method to restore the FoxPro files from the 120 GB hard drive is not possible. As has been demonstrated, any FoxPro file that is recovered is suspect as to its accuracy pertaining to the original file before deletion.

In this regard, the viability of the recovered files cannot be assumed and any file recovered must be individually inspected, test and verified to ensure it functions as originally designed. This is a task that would need to be undertaken by FoxPro specialists who are cognizant of the original specifications of the design before releasing to any clients. Based on my knowledge and experience gained while working as a software programmer, failure to perform this in-depth verification of the recovered files could cause catastrophic failure if clients were to use these files in production.

I HEREBY DECLARE THAT THE ABOVE STATEMENTS ARE TRUE TO THE BEST OF MY KNOWLEDGE AND BELIEF, AND THAT I UNDERSTAND THEY ARE MADE FOR USE AS EVIDENCE IN COURT AND ARE SUBJECT TO PENALTY FOR PERJURY.

Dated May 27, 2010

Mark Cox
